Binary Trees

A binary tree is a tree data structure in which each node has at most two children, called left and right. A binary search tree keeps left < node < right, which makes search, insertion and deletion O(log n) on average. Tree traversal can be inorder, preorder or postorder.

Graph Traversal

Breadth-first search (BFS) visits graph vertices level by level using a queue. Depth-first search (DFS) uses a stack or recursion. Graph traversal runs in O(V + E) time.
